

AUTOMATION JOURNEY MAP

Implementation Considerations

1. Requirements Gathering. Goal: Understand business context and data dependencies before designing anything.
Pain points: Manual exports, inconsistent updates, duplicate volunteer records, and delays in onboarding.
Data sources: Microsoft Forms (submission data). CRM (volunteer records, departments). Insight Hub (reporting layer).
Business Purpose: Clarify why the system or process is needed (e.g., track supporter engagement, consent updates, volunteer management).
Scope Boundaries: Define what's in scope and what's explicitly out of scope to avoid creep later.(How often is data needed (daily, hourly)? Does this affect contact on CRM consent?)
2. Workflow Design Goal: Map the end-to-end flow from form submission to insight.
Ingestion: Use Data Pipelines to pull data from the Online Form API or connected Excel/SharePoint source. Refresh Schedule.
Transformation: Use Dataflows Gen2 to clean, standardize, and map and enrich fields (e.g., "IsSupporter"). Apply business rules for department routing.
Storage: Store curated data in the Lakehouse for unified access.
Semantic Model: Define relationships (Volunteer ↔ Department ↔ Application Status). Create measures for KPIs (e.g., "Average Processing Time," "Applications Per Department").
Feed cleaned data into CRM. &/or Visualization: Power BI dashboards for Decision makers.
3. Tool Selection Goal: Choose Fabric components that balance automation, cost, and maintainability.
Data Pipeline (Scheduled extraction from MSForms/SharePoint) → Dataflows Gen2 (Cleaning, mapping, enrichment) → Spark Notebook (Advanced joins, API pagination, or ML scoring) → Lakehouse (Unified, scalable repository) → Semantic Model (Consistent definitions for reporting) → CRM & Power BI (Dashboards and departmental insights)
4. Data Pipeline (Scheduled extraction from Website → Lakehouse → CRM)
5. Integration & Modelling Semantic Model (Star Schema → Power BI)
Apply Validation rules: Check for missing fields, duplicates, store consent flags..
6. Data Quality & Governance Goal: Ensure accuracy, compliance, and trust.
Error handling: Log failed pipeline runs; send alerts to data team. GDPR compliance: Mask personal data where unnecessary;
Role-based access: Analysts see raw data; relevant managers only see relevant enriched data.
7. Implementation Dashboards & Insights Goal: Build iteratively and validate each product. Prototype pipeline for one department (e.g., Fundraising). Validate data accuracy against manual exports. Expand to other departments. Integrate semantic model and dashboards. Automate refresh and error notifications.
8. Continuous Improvement Audit trail: Use Fabric monitoring to track refreshes and changes.
Documented data-quality framework with automated checks. Sync tests for reliability and scalability
